artificial gene and the resulting mosaic protein improve the sensitivity, spectrum of immunoreactivity, and antigen specificity of enzyme immunoassays. This provides improved detection of hepatitis C virus. Sequences AAV06673-681 represent amino acid sequence of each monomer comprising the NC mosaic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                              FILILITE FILITIFILITIFILITE PREPARENCE PREPARENCE PROPERTY OF THE PROPERTY OF

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                     The invention relates to a mosaic protein, comprising a plurality of homologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also provided. The method is designated restriction endonuclease assisted are useful for detecting a hepatitis infection in an individual. The mosaic gene and protein is also useful for vaccination against infection, especially hepatitis of the method of synthesizing the artificial gene and the resulting mosaic protein improve the sensitivity, spectrum of immunoreactivity, and antigen specificity of enzyme immunoassays. This provides improved detection of hepatitis C virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  homologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also provided. The method is designated restriction endonuclease assisted ligation (REAL). It codes for AARS8593 an antigen to a structural region of the HCV virus, which can be used in the diagnosis of NANBH patients and the detection of HCV carriers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   homologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosalc protein is also provided. The method is designated restriction endonuclease assisted rigation (REAL). The mosalc protein and the artificial mosalc protein are useful for detecting a hepatitis infection in an individual. The mosalc gene and protein is also useful for vaccination against infection, especially hepatitis C. The method of synthesizing the infection, especially hepatitis C. The method of synthesizing the spectrum of immunoreactivity, and antigen specificity of enzyme immunoassays. This provides improved detection of hepatitis C virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polymerase chain reaction; PCR; amplify; primer; non-A, non-B hepatitis; NANBH; virus; blood transmissible; detection; hepatitis virus; RT-PCR; C100 antibody; HCV RNA; NS5 region.

The invention relates to nucleic acid construct which comprises an expression cassette including a first polynuclectide region including a 5 non-cooling region (URN) sequence of an RNA, virus and at least an N-terminal portion of a coding sequence of RNA virus, a second colynuclectide region including a 3' untranslated region (UTN) sequence of the RNA virus and at least a C-terminal portion of a coding sequence of the virus and a third polynuclectide region encoding a reporter molecule, flanked by first and second polynuclectide regions; and a promoter sequence being operatively linked to expression cassette in a manner so as to enable a transcription of a minus strand RNA molecule from the expression cassette. Nucleic acid construct of the invention is useful for detecting the presence of an RNA virus in a cell. It is also useful for screening anti-viral drugs and determining drug resistance of an RNA virus. The present sequence is Hepatlitis C virus (HCV) isolate HCV-Si full-length polyprotein.
  Novel nucleic acid construct useful for detecting the presence of RNA virus, comprises an expression cassette and a promoter operably linked to expression cassette for minus strand RNA transcription of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence is encoded by the oligonucleotide, CN14, and represents the peptide fragment CP14. CP14 is a fragment of the core region of hepatitis C virus (HCV). CP14 may be used in the detection of HCV infection and to raise antibodies against it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detection of hepatitis C virus - using oligopeptide fragment of core region

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence is encoded by the genome of a blood transmissible non-A, non-B hepatitis (NANBH) virus. The CDNA sequence was isolated using the primers given in AAQ63500-35. The amplified fragments are used in the detection of hepatitis virus. The target DNA was isolated from serum of chronically infected NANBH patients who were Cl00 antibody-positive and HCV RNA (NS5 region) positive. Reverse transcription-PCR and PCR were performed on CDNA and the total human NANBH DNA was constructed from 23 clones.

They represent the beginning of the HCV open reading frame to amino acid 38 and encompass the "common" sequence. These peptides are contained in the capsid protein of the virus and themselves contain epitope artibodies in the diagnosis of non-A, non-B hepatitis (NANBH), and in competitive inhibition assay for detecting HCV specific

Gaps
The sequences given in AAR30665-89 represent fragments of the Hepatitis C virus (HCV) amino acid sequence. They represent the beginning of the HCV open reading frame to amino acid 3M and encompass the "common" sequence. These peptides are contained in the capsid protein of the virus and themselves contain epitope artibodies in the diagnosis of non-A, non-B hepatitis (NANDH), and in competitive inhibition assay for detecting HCV specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hepatitis C virus; HCV; open reading frame; "common" sequence; capsid protein; epitope; immunoassay; antibody; diagnosis; NANBH; non-A, non-B hepatitis; competitive; inhibition assay.

The present sequence represents a Hepatitis C virus (HCV) protein sequence from the disclosure of the present specification. The present specification describes a chimeric HCV peptide antigen which comprises at least 2 peptide epitope regions from the HCV polypeptide core region, 2 peptide epitope regions from the NS3 region and at least 2 peptide epitope regions from the NS4 region. The antigen binds specifically with an antibody produced by a human infected by HCV. The peptide can detect a wide range of HCV infections with high sensitivity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New chimeric peptide antigen derived from hepatitis C virus protein - useful for detecting \mbox{HCV} infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hepatitis C virus; HCV; chimeric; antigen; detection; core region; epitope; NS3; NS4; infection.
                                                                                                                                                                                                                                         ö
                                                                                              Hepatitis C virus #4 and #6 genes were isolated (AAQ64068-69).
Both genes contain the core, ENV, NS1, NS2 and NS3 regions.
A core region fragment is given in AAQ64067.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                         The sequences given in AAR30665-89 represent fragments of the Hepatitis C virus (HCV) amino acid sequence. They represent the beginning of the HCV open reading frame to amino acid 38 and encompass the "common" sequence. These peptides are contained in the capsid protein of the virus and themselves contained in the capsid protein of the virus and themselves contained in acroups. These peptides can be used in immunoassays for HCV antibodies in the diagnosis of non-A, non-B hepatitis (NANBH), and in competitive inhibition assay for detecting HCV specific
                                                                                                                                                                                                                                                         Synthetic peptide epitope with sequence encoded by hepatitis-C virus - for immunoassay for antigens for diagnosis of non-A, non-B hepatitis

Peptides AAY26949-Y26955 represent peptide epitopes derived from the N-terminus of the hepatitis C virus core protein. The peptides are used to generate monoclonal antibodies or antibody fragments specific for hepatitis C virus (HCV) core protein. The monoclonal antibodies are used for early diagnosis of HCV infections, especially by two-antibody
                                                                                                                                                                                                                                                                                                                                                           Monoclonal antibodies useful for detecting and/or quantifying hepatitis \mathsf{C} virus core protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polypeptides that bind to anti-hepatitis C virus antibodies, useful for

Antibodies are used correspondingly to detect HCV or related antigens. The peptide and antibodies may also be used to treat or prevent HCV infections. The present sequence represents the N-terminus of the core p21 protein of hepatitis C virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a peptide, which is recognised by antibodies against amino acids 2-45 at the N-terminus of the core (or nucleocapsid) by 1 protein of hepatitis C virus (HCV), or its variants. The peptide has a tertiary structure consisting of two alpha-helical fragments, almost perpendicular to each other in space, connected by a junction peptide. Excluded are all proteins and peptides comprising, or consisting of, the N-terminal part of p21 (starting from amino acid 1 or 2). Also new are (1) monoclonal or polyclonal antibodies produced using the peptide as an immunogen and (2) complex consisting of the peptide specifically bound to some other molecule, particularly peptide or nucleotide fragments or functionalised aromatic compounds. The peptide is used (1) as immunogen for generating antibodies and (11) for detecting and guantifying either antibodies against p21 or HCV-derived mRNA (by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       nsed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

diagnosing and preventing hepatitis C infections -
```

Claim 1; Page 42; 50pp; English.

The present peptide, designated 542G, corresponds to residues 2 to 45 of the N-terminus of the human hepatitis C virus (HVV) core protein. It is an immunodominant region containing conformational type epitopes and linear type epitopes. It manifests an immunoreactivity with all the sera of individuals or blood samples infected with HCV and which possess substituted for homologous amino acros protein. An amino acid may be substituted for homologous amino acids and side chains and peptide bonds may be modified. For example, L-amino acids may be replaced by D-amino acids, amine groups may be acetytated, and so on. The native antigenic sequence and its antigenic derivatives may be used for detection of hepatitis C virus and for raising antibodies against the virus.

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- FUNCTION: THE SMALL PROTEINS NS2B, NS2B, NS4B AND NS4B ARE HYDROPHOSIC. SUGGESTING A POSSIBLE MEMBRARE RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
C SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPPORTOTEIN MAND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                            01-AŭG-1992 (Rel. 23, Created)

-1- FUNCTION: THE SMALL PROTEINS NS2B, NS4B AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:

PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C. AND MRNA.

"Complex of NS3 protease and NS4 peptide of EM strain hepatitis C rius: a 2.2-A resolution structure in a hexagonal crystal form.";

Protein Sci. 7:837-847(1998).

-1- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL END RSA REPLICATION.

-1- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1.

-1- CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                   the viral
                                                                                       Love R.A., Parge H.E., Wickersham J.A., Hostomsky Z., Habuka N., Moomaw E.W., Adachi T., Hostomska Z.; Habuka R.W., The crystal structure of hepatitis C virus NS3 proteinase reveals trypsin-like fold and a structural zinc binding site."; Cell 87:331-342(1996).

"Molecular structure of the Japanese hepatitis C viral genome.";
FEBS Lett. 280:325-328(1991).
-! FUNCTION: THE SMALL PROPEIRS NS2A, NS2B, NS4A AND NS4B ARE
-! FUNCTION: THE SMALL PROPEIRE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-! CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.
-! CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ø,

THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA. PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY PROTECUXIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.
SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29. SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Genomic structure of the human prototype strain H of hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MEDLINE-92052256; Pubmed-1658800;

Amcleotide sequence of the genomic RNA of hepatitis C virus isolated from a human carrier: comparison with reported isolates for conserved of divergent regions.";
J. Gen. Virol. 72:2697-2704(1991).
C -I- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
C -I- CATALYITC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in Pl and Ser or Ala in Pl'
C -I- CATALYITC ACTIVITY: N nucleoside triphosphate - N diphosphate +

Genome polyprotein (Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein E1 (GP32) (GP35); Envelope glycoprotein E2 (GP69) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS5A (P56); Nonstructural protein NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Viruses; SENNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                              (RNA)(N).
SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

01-AUG-1992 (Rel. 23, Last sequence update)
28-FEB-2003 (Rel. 41, Last annotation update)
26-nome polyprotein (Contains: Capsid protein (Core protein) (P22);
66-nome polyprotein E1 (GP22) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3 4.22.-); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3 4.22.-); Nonstructural protein NS4A (P4); Nonstructural protein
NS4B (P27); Nonstructural protein NS5A (P66); Nonstructural protein
NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)]
Hepatitis C virus (isolate HC-38) (HCV).
Pfam; PF01506; HCV_NS5a; 1.
Pfam; PF00271; helicase_C; 1.
Pfam; PF00998; Viral_RdRP; 1.

-!- SUBCELLULAR LOCATION: SEEMS TO BE LOCALIZED INTRACELLULARLY TO THE TRANS GOLGI NETWORK. PROPEPTIDE CLEAVAGE IS A PREREQUISITE FOR EXIT OF FURIN MOLECULES OUT OF THE EMDOPLASMIC RETICULM (ER).
SECOND CLEAVAGE IN THE PROPEPTIDE OCCUR IN THE TRANS GOLGI NETWORK (TGN), WHICH IS FOLLOWED BY THE RELEASE OF THE PROPEPTIDE BOUND TO FURIN MOD THE ACTIVATION OF FURIN.
-!- TISSUE SPECIFICITY: SEEMS TO BE EXPRESSED UBIQUITOUSLY.
-!- DOMAIN: CONTAINS A CYTOPLASMIC DOMAIN RESPONSIBLE FOR ITS TGN LOCALIZATION AND RECYCLING FROM THE CELL SURFACE.
-!- PTW: THE PROPEPTIDE IS AUTOCAPALYTICALLY REMOVED THROUGH AN INTRAMOLECULAR CLEAVAGE PROBABLY IN THE ENDOPLASMIC RETICULUM (ER). IN THE TGN THE SECOND CLEAVAGE IN THE PROPEPTIDE COULD LEAD

-I- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MANA (BY SIMILARITY).

single Japanese carrier in Nagasaki prefecture and genome analysis of E1 and E2/NS1 envelope glycoprotein regions.";
Jpn. J. Trop. Med. Hyg. 22:16941.
-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA (BY SIMILARITY).

-1-SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLECCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA (BY SIMILARITY)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;

STRAIN-HCV-BB5;
Songsivilai S., Kanistanon D., Kunkitti R.;
Identification and characterisation of Thai isolates of hepatitis C
       Submitted (MAR-1995) to the EMBL/GenBank/DDBJ databases.
-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GIVCORROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA (BY SIMILARITY).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        virus.";
Submitted (MAR-1995) to the EMBL/GenBank/DDBJ databases.
--- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GINCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;
